

Temple Fay, and the recommendations of Dr. and Mrs. Bobath about doing what one can to inhibit various primitive reflexes and abnormal postures. The booklet will be of much interest, especially to physiotherapists.

The second booklet, called *Enuresis*, consists of three papers which originally appeared in the *Barnardo Staff Gazette*, the first being by Miss D. M. Dyson, a chief executive officer; the second by Dr. C. V. Bloom, chief medical officer; and the third by Dr. Elizabeth Whatley, consultant psychiatrist to the Child Guidance Clinic. Thus the subject is usefully presented from different angles by authors who have had considerable experience of the problem; and they all discuss it with common sense, understanding, and sympathy.

In the absence of any treatment that will guarantee a quick cure it is important to consider all the constitutional and environmental influences that may operate in each case, and to remember that a small number of the sufferers have an organic lesion needing attention. Emphasis is placed on general management, and this varies to some extent with the type of child and the circumstances of his life. Drugs are mentioned, but without enthusiasm, and this reflects the views of most clinicians. The warning bell or buzzer has been used for a total of 40 cases (37 boys and three girls) with the following results: cured, eight; much improved, seven; some improvement, five; no improvement (often due to lack of co-operation) 13. Still under trial at the time, seven.
