Also a List of Registered Practitioners resident Abroad, and of those in the Army, Navy, and Indian Services.

With much General and Statistical Information relating to Medical Education and Practice. 2100 pp., 8vo, 14s.

London: 7, Great Marlborough Street.

J. & A. CHURCHILL'S List is continued on page 3 of the Advertisement Sheet.

"Allenburys" Foods

FOR

Infant Feeding

A PROGRESSIVE SERIES OF FOODS.

The Foods constituting the series described below are not interchangeable, but should be used in succession as indicated. Perfectly sterile in themselves, they are best given with the "Allenburys" Feeder, which is capable of easy and complete sterilization, thus presenting a physiologically accurate diet, free from all fear of contamination by the products of decomposition.

THE

"Allenburys" Milk Food No. 1

Affords, when prepared for use, a correct substitute for human milk. It is manufactured from fresh cow's milk, so modified as to present all the constituents of human milk in their true relative proportions. Being in a desiccated and sterilized form, it requires only the addition of *boiled* water to obtain a pure and sterile food suitable for infants during the first three months of life.

THE

"Allenburys" Milk Food No. 2

Is identical with No. 1, with the addition of small quantities of maltose, dextrine, and soluble phosphates derived from the digestion of whole meal with Malt Extract. These ingredients are a valuable adjunct to the increasing needs of digestion, yet the Food is readily and easily assimilated, there being no unconverted starch present. The No. 2 Food is designed for children between three and six months of age.

THE

"Allenburys" Malted Food, No. 3,

USUALLY KNOWN AS

Allen & Hanburys' Malted Infants' Food,

Is not a *milk*, but a purely *farinaceous* Food, prepared by improved methods after Baron von LIEBIG's formula. The basis is fine wheaten flour, which has been thoroughly cooked and partially digested by an active Malt Extract, so that a large proportion, but not all of the starch has been converted. It is particularly rich in soluble phosphates and albumenoids.

This Food should be given from six months and upwards. For the first month or so after the change of diet it is generally advisable, instead of using cow's milk, to employ the "ALLENBURYS" MILK FOOD No. 1 or No. 2 in preparing it. The demand on the child's digestive organs is less abrupt, and a humanized milk is used in place of the more indigestible cow's milk. This precaution is specially recommended in the case of delicate children.

The "Allenburys" Feeder.

This bottle has the nipple at one end and a valve-stopper at the other, so that, both being removed, it can readily be cleansed under the tap. The valve admits air behind the column of milk, thus avoiding the swallowing of air and the resulting wind-colic; while the rubber nipple is easily detached, and can be turned inside out. The bottle is graduated approximately in ounces. Price 1/- each.

The "Allenburys" Thermometer, in nickel case, as figured, is provided for determining the right temperature at which the Foods should be given, and for general Nursery use. 1/- each.

Allen & Hanburys Ltd., Plough Court, Lombard Street, London.

Infants' Food Manufactory: WARE MILLS, HERTFORDSHIRE.

For further details concerning these Foods, see succeeding numbers of the *British Medical Journal* and *Lancet*.
