

Prescription Feeding of Infants

A great deal is heard just now of standardisation, but nutritional requirements of infants are not susceptible to such regimentation, and exceptions will be found to "prove" almost every rule.

The great majority of infants thrive on COW & GATE FULL CREAM MILK FOOD, but for the remainder "prescription" feeding is available to the doctor in a range of special foods of which the following is a selection:

HALF CREAM

For fat intolerance and cases requiring reduced protein.

HEMOLAC

With supplementary iron in the form of ferri et ammon. cit.

HUMANISED

Approximating to breast milk in balance of fat, protein and carbohydrate.

LACIDAC

Lactic acid food for cases of gastro-intestinal disturbance. In three grades, Separated, Half Cream and Full Cream, to permit graduation of feeding in returning to normality.

FRILAC

For prematures.

ALLERGILAC

For dermatitis and other allergic manifestations of milk protein sensitivity.

PROLAC

For gastro-enteric cases and others requiring increased protein.

MODILAC

With carbohydrate modification employing dextrin and dextrose.

Full particulars of these and other special foods are available on application to:

COW & GATE LTD.

GUILDFORD, SURREY © 3308

A resting state of the ovaries may be suspected in women who (a) fail to develop fully at puberty, or (b) regress physically after delivery. The ovaries can be grossly stimulated by injections of the equine gonadotrophin

G E S T Y L

either by persistent intramuscular injection; at daily or short intervals of 400 i.u., or by single or divided intravenous injection, at cyclic intervals, of 400 to 1000 i.u.

Such stimulation, though not always followed by overt cyclic hæmorrhages, should be adequate to direct the physical trend toward normality.
