ALKALI THERAPY WITH THE SULPHONAMIDES

It is generally accepted, and has been widely advocated, that fluids should be administered during sulphonamide therapy in quantities sufficient to maintain large daily urinary volumes. Many physicians have established Alka-Zane as a systemic alkalinizer in rendering and maintaining the urine neutral or slightly alkaline.

Alka-Zane is composed of sodium, potassium, calcium and magnesium—the four principal bases of the alkali reserve—in the readily assimilable form of carbonates, citrates and phosphates. Therefore, Alka-Zane supplies not only one but several of the alkaline salts.

Alka-Zane is a pleasant-tasting, invigorating drink, and is exceptionally well tolerated by the patient.
