

A general antiseptic for the use of the physician requires careful selection in order to meet his many requirements in the surgery, home and hospital. The antiseptic should be capable not only of demonstrable germicidal action in the test tube, but it should be equally effective against the various types of organisms encountered in infections. It should be stable, non-toxic, non-irritating, odourless and stainless.

Solution S.T. 37 meets these requirements. It is therefore ideally suited as a general antiseptic for application to open wounds and mucous surfaces.

Its clinical applications are many; for irrigation of the kidney pelvis, bladder, vagina and colon; for topical application to the cervix, vagina and external genitalia: as a wet dressing for pyogenic infections after establishing free drainage; as wet dressings in the treatment of cuts, abrasions, burns, scalds and other open wounds; in the treatment of inflamed, irritated or infected conditions of the ear, nose and throat by topical application, spray or irrigation.

Solution S.T. 37 is supplied in three-ounce, five-ounce and twelve-ounce bottles.
