

OESTROFORM

For rapid relief of menopausal symptoms

"For the nervous and vasomotor symptoms of the menopause, flushings, irritability, nervous depression, indigestion, and sleeplessness, the oestrogenic hormone is virtually specific if employed in adequate and properly spaced dosage"
(Practitioner, October 1938, p. 377).

The most satisfactory method of employing the oestrogenic hormone is by the injection of Oestroform 50,000 international benzoate units twice weekly in severe cases, or 20,000 international benzoate units twice weekly in cases of moderate severity. This will be found to produce rapid relief of symptoms in all conditions associated with the menopause.

As soon as alleviation of symptoms has been attained the dosage of Oestroform outlined above should be reduced, since the object of treatment is not to postpone the onset of the menopause indefinitely by the administration of large doses of oestrogenic hormone, but merely to keep the distressing symptoms in abeyance, thus allowing the patient to become adjusted gradually to the endocrine changes which are taking place.

AZOL

BRAND

Hexazole

For the shock (convulsive) treatment of Schizophrenia

AZOL is a British made product which is the same as the German preparation, 'AZOMAN,' supplied as a 5 per cent solution for the shock (convulsive) treatment of schizophrenia and for use as an analeptic.

AZOL is equal in all respects to the product formerly imported from Germany.

AZOL may be administered either intravenously or intramuscularly and is especially valuable as an alternative to Phrenazol in cases where intramuscular injection is desirable.
