NIZORAL

If you do, you know why Nizoral cream is the right answer to seborrhoeic dermatitis

Apply twice daily until a few days after remission of symptoms.

Indications: Nizoral cream is indicated for topical application in the treatment of dermatophyte infections of the skin, as well as in the treatment of cutaneous candidosis and tinea (pityriasis) versicolor. Nizoral cream is also indicated for the treatment of seborrhoeic dermatitis, a skin condition related with the presence of *Pityrosporum ovale*. **Precautions:** Irritation may occur when Nizoral cream is used immediately after prolonged treatment with topical corticosteroids. Therefore, it is recommended to continue applying the topical corticosteroid in the mornings and to apply Nizoral cream in the evenings, and to subsequently and gradually withdraw the steroid therapy over a period of 2-3 weeks.

Genetics is a subject fundamental to medicine, but rapid advances in recent years may make the subject complex and confusing to clinicians and paramedical staff outside the specialty. Nevertheless, the demand for genetic investigation and counselling is increasing, and these services need to be offered by clinicians other than clinical geneticists. In the *ABC of Clinical Genetics* Helen Kingston, consultant clinical geneticist at St. Mary's Hospital, Manchester, reviews basic concepts of inheritance in mendelian, chromosomal, and multifactorial disorders; outlines the investigation and management of genetic conditions; and illustrates the application of recombinant DNA technology to clinical practice. Implications of genetic diseases for relatives are also considered, together with the ethical and human dilemmas that face doctors and patients and their families.
