

# KEY WORDS OF MODERN ANTIFUNGAL THERAPY

## THE REASSURING FACTOR:

# NO REDISTRIBUTION...

After oral intake, itraconazole is delivered to the skin: 1. by excretion via the sebaceous glands and 2. by passive diffusion from the blood into the keratinocytes in the epidermis. Its antifungal activity in the epidermis continues for a full epidermal cycle (4 weeks) after the end of therapy, as its lipophilic structure prevents redistribution via the bloodstream.

Fungi and yeasts are notorious for their ability to entrench themselves in what may be called *the outside*: the skin, nails, hair and mucosa.

As for antifungal therapy, an effective way to reach all parts of that outside is via *the inside*, i.e. by the systemic route.

Ideally, an oral antimycotic should quickly disappear from the bloodstream and firmly establish itself in keratinous and mucosal tissues. And preferably, having reached its destination, *it should remain in those tissues and not be released back into the bloodstream.*

This is precisely what happens with itraconazole (Sporanox). Because of its lipophilic structure, it is strongly attracted to the epithelial cells, from where it will only be eliminated — *and only towards the outside* — as those cells gradually desquamate. During all that time its antifungal activity continues.

In fact, this strong fixation to — and inside — the outside tissues is what now permits the use of short, fixed, oral antifungal treatment schedules.

**Properties:** Sporanox (itraconazole), a triazole derivative, is orally active against infections with dermatophytes (*Trichophyton* spp., *Microsporum* spp., *Epidermophyton floccosum*), yeasts (*Candida* spp., *Pityrosporum* spp.), *Aspergillus* spp. and various other yeasts and fungi. **Indications:** Sporanox (itraconazole) is indicated for vulvovaginal candidosis, pityriasis versicolor, dermatophytoses, fungal keratitis and oral candidosis. **Dosage and administration:** Vulvovaginal candidosis: 2 capsules (200 mg) morning and evening for 1 day; pityriasis

versicolor: 2 capsules (200 mg) once daily for 7 days; tinea corporis, tinea cruris, tinea pedis, tinea manus: 1 capsule (100 mg) daily for 15 days; highly keratinized regions, as in plantar tinea pedis and palmar tinea manus, require 1 capsule (100 mg) daily for 30 days. Oral candidosis: 1 capsule (100 mg) daily for 15 days. Fungal keratitis: 2 capsules (200 mg) once daily for 21 days. **Contra-indications:** Sporanox (itraconazole) is contra-indicated during pregnancy. **Warnings and precautions:** Although clinically Sporanox (itraconazole) has

not been associated with hepatic dysfunction, it is advisable not to give this drug to patients with a known history of liver disease. **Nursing mothers:** It is recommended not to breast feed whilst taking Sporanox (itraconazole). **Drug interactions:** Sporanox (itraconazole) should not be given concomitantly with rifampicin.

# How is no longer a problem — but there's still which and why

The microcomputer revolution has made powerful machines and highly complex programs generally available. This means that users of statistical techniques need no longer be concerned with the arithmetical and algebraic details — the software will take care of all that. What is vital, however, is to understand the ideas and the basic principles of statistical analysis. In *Medical Statistics on Microcomputers* R A Brown and J Swanson Beck show how to get the best use out of microcomputers when analysing data, particularly in the pathology laboratory. They explain the rational basis of various widely applicable statistical methods and also indicate their limitations so that you can make an informed choice. Chapters include:

- Data handling
- Analysis of data from one or two groups
- Comparison of several groups
- Analysis of categorical data
- Statistical methods for diagnostic tests.

**STATISTICS WITH CONFIDENCE** — Confidence intervals and statistical guidelines. Martin J Gardner, Douglas G Altman.

Many medical journals, including the *British Medical Journal*, now expect scientific papers submitted to them to contain confidence intervals when appropriate. Why? what are they? and how do you calculate them? *Statistics With Confidence* tells you. A clear explanation of the reasons for using confidence intervals is followed by detailed presentation of methods of calculation, including numerous worked examples and specially compiled tables. To make things even easier, a computer programme, Confidence Interval Analysis (CIA), for calculating confidence intervals, has been specially designed by Martin Gardner and details are available from the Publishing Department, *British Medical Journal* (or the American College of Physicians).

**STATISTICS IN PRACTICE** — Sheila M Gore, Douglas G Altman

No doctor can afford to ignore statistics: most modern medical research uses statistics. This important and authoritative book provides clear information on designing studies, applying statistical techniques, and interpreting studies that use statistics. It can be easily understood by those with no statistical training and should be read by all those who want to keep abreast of new developments.

# gastric distress & oesophagitis hyperacidity or dysmotility?

Most complaints of gastric distress, as well as oesophagitis, are conventionally attributed to hyperacidity in the stomach. However, the contemporary view in gastroenterology holds that most upper G.I. problems, including heartburn, postprandial fullness, early satiety, abdominal distension and epigastric discomfort, are commonly motility related.<sup>1-3</sup> And this stands to reason. After all, proper peristalsis is a physiological necessity for our digestive process.

Prepulsid, the novel G.I. prokinetic, uniquely restores healthy peristalsis to efficiently clear the oesophagus and empty the stomach.<sup>4-6</sup>

expertise in digestive motility

Prepulsid (cisapride) is a gastro-intestinal prokinetic agent. Prepulsid enhances and co-ordinates gastro-intestinal propulsive motility, thereby preventing stasis and reflux. Therapeutic indications: 1. Gastroesophageal reflux disorders, including oesophagitis. 2. Symptoms of X-ray or endoscopy negative upper digestive discomfort. 3. Gastro-oesophageal reflux disorders, including oesophagitis. 4. Intestinal pseudo-obstruction. Contra-indications: No absolute contra-indications are known. Precautions: Pregnancy. Although, in animals, there is no effect on primary fertility, no primary embryotoxic and no teratogenic effect, the anticipated therapeutic benefits should be weighed against the potential hazards before Prepulsid is given during pregnancy, especially during the first trimester. Caution should be exercised when Prepulsid is administered to nursing mothers as advised not to breast feed while taking Prepulsid. Driving and machine-operating ability: Prepulsid does not affect psychomotor function and does not induce sedation or drowsiness. Prepulsid may, however, accelerate the absorption of central nervous system depressants, sedatives, H<sub>2</sub>-blockers. In patients receiving anticholinergics, the coagulation times may somewhat increase. It is advisable to check the coagulation time one week after the start of Prepulsid treatment to adapt the anticoagulant dose if necessary. Interactions: The acceleration by Prepulsid of gastric emptying may affect the rate of absorption of drugs. Absorption of drugs from the stomach may be impaired in patients with severe gastric motility disorders. The most well tolerated side effects for the most part, anticipated by anticholinergic drugs, in hepatic and renal insufficiency. It is recommended to have the initial daily dose. Subsequently, this dose can be adapted, depending on the therapeutic effects or possible side-effects. In the elderly, steady-state plasma levels are generally higher. Side effects: In clinical trials, the most common side effects were dry mouth, constipation, headache, dizziness, diarrhoea, flatulence, nausea, vomiting, and abdominal pain. In the case of drugs that require individual titration, it may be useful to monitor plasma levels of such drugs when Prepulsid is associated. Adverse reactions: In line with the pharmacological activity of Prepulsid, the following side effects were observed: diarrhoea, flatulence, nausea, vomiting, and abdominal pain. When diarrhoea occurs in babies or infants, the dose should be reduced. There have been isolated reports of convulsive seizures without clearcut relationship to Prepulsid. Dosage: Adults: according to the clinical trial, the average 0.2 mg/kg per intake, to be taken as tablets or as oral suspension (the full plastic 5-ml spoon contains 5 mg). As a rule the following doses have proven adequate: \* severe conditions (gastroesophageal reflux, oesophagitis, refractory constipation): 10 mg t.i.d. (before the 3 main meals and before bedtime). \* infants and children: on the average 0.2 mg/kg per intake, 3 to 4 times daily. For the suspension, intakes are increased on the dosing pipet as a function of body weight. All pharmaceutical information available on request. Note: Prepulsid (cisapride) is not yet available in all countries and not all indications have been approved everywhere.
