**The Microscope: its History, Con-**

**STRUCTION and APPLICATIONS.** By JABEZ HOGG, M.R.C.S., Assistant-Surgeon to the Royal Ophthalmic Hospital, Charing Cross.

"This edition has been improved and enlarged, and fifty new illustrations of microscopic objects added. The work commences with a short history of the instrument, and then proceeds to enter into the details of its optical and mechanical arrangements. The accessory apparatus is explained, a chapter given upon mounting, collecting, preparing, injecting, polarized light, and the application of photography. The author then proceeds to point out the most interesting objects for study, commencing with infusorial animalcules, zoophytes, sponges, mollusca, crustacea, articula, which includes a very interesting account of many insects. He then passes on to the structure of animals, and lastly, that of vegetables. Thus we have the lowest and the highest forms of life illustrated. The adulterations of articles of food are not forgotten, especially that of flour, bread, coffee, etc. Altogether, it is a complete cyclopædia of information, omitting nothing essential to the study of microscopic science in all its varied details. The whole forms a decidedly good and popularly-written work of the ever-interesting study of the invisible and minuter parts of creation."—*Illustrated London News*.

London: H. INGRAM & Co., 198, Strand; and all Booksellers.

Small 8vo, cloth, price 1s.
