Hemoplastin

An Improved Product

HEMOPLASTIN or Hæmostatic Serum, P., D. & Co., is a sterile fluid, composed principally of prothrombin, thrombokinase and anti-antithrombin, ready for immediate use by subcutaneous injection or topical application. It has proved eminently satisfactory in the prophylaxis and treatment of hæmorrhage, particularly in those cases due to defective coagulability of the blood.

With the object of rendering Hemoplastin still more effective, steps have recently been taken to free it from protein, thus increasing the factor of safety from anaphylaxis, or reactions simulating anaphylaxis, and hastening the absorption of the effective dose.

Hemoplastin has not been changed in its essential constituents. It remains the most logical and generally useful blood coagulant, shortening coagulation time to a fraction of the normal without danger of intravascular clotting.

The efficiency of Hemoplastin is established by physiological test before issue.

Supplied in bulbs of 2 c.c. Further particulars will be sent on request.
