VITAMIN DEFICIENCY

"If we know anything of vitamins we know them to be contained in uncooked foods and absent relatively from cooked, and we know, too, that the community lives upon a diet from which uncooked foods are carefully excluded . . . Intensive vitamin dietary . . . is extraordinarily efficacious therapeutically. It not only assists other forms of treatment . . . but it is itself positively curative in most forms of chronic disease." ("British Medical Journal," July 31, 1920, p. 157).

METAGEN will enable the physician, as a rule, to deal successfully with cases of avitaminosis when complete diet is difficult to obtain.

METAGEN is a combination of active vitamin extracts derived from natural sources. It provides a convenient means of making up for any deficiency of vitamins in the diet. It is physiologically tested to demonstrate its therapeutically active condition.

METAGEN, by its power of stimulating metabolism, is of great service in all cases of malnutrition and impaired body tone (rickets, marasmus, simple anæmia, chlorosis, neuritis).

METAGEN is also a valuable auxiliary in the building up of nutrition; for example, in convalescence from febrile diseases, pregnancy, lactation, tuberculosis in the first or second stage, etc.

METAGEN is supplied in bottles each containing 50 capsules. For further particulars please refer to our illustrated booklet on Metagen, which will be sent to physicians, post free, on request.
