- All letters must be typed with double spacing and signed by all authors.
- No letter should be more than 400 words.
- For letters on scientific subjects we normally reserve our correspondence columns for those relating to issues discussed recently (within six weeks) in the BMJ.
- We do not routinely acknowledge letters. Please send a stamped addressed envelope if you would like an
 acknowledgment.
- Because we receive many more letters than we can publish we may shorten those we do print, particularly when we
 receive several on the same subject.

AIDS: counting the cost

SIR,—The average survival time for patients presenting at St Mary's Hospital with the acquired immune deficiency syndrome (AIDS) to December 1986 was one year. It has been agreed by Paddington and North Kensington Health Authority that the most appropriate model of care for people with AIDS is largely community based and that people should be enabled to live and be cared for in the community for as long as possible, assuming that this is what they wish. Not only is this model considered to be the most appropriate for patients' needs but also, if conservative predictions of numbers of patients with AIDS alive by the year 1992 are realised, it will be quite unrealistic to expect the current rate of acute bed usage to be maintained. Were current referral patterns and bed usage to remain unchanged, with 18.5% of patients with AIDS in acute hospital beds at any one time, then the number of beds required by the district in 1992 would be 592. The authority has thus agreed that each patient should have a package of care designed to support him or her in the community as far as possible and to avoid unnecessary use of acute hospital beds. A theoretical package of care has been designed for a hypothetical "average" adult patient as follows.

A total of four weeks' hospital inpatient care, with 11 months' treatment at home. The 11 months' community care includes four months'

day care treatment, including food, transport, etc, during which time a home help would be provided for one hour a day. For seven months the patients would be managed by the acute district nursing service, in conjunction with the home care team, who would be responsible for managing incontinence, providing equipment, etc. For six months of that time a home help would be required for three hours, seven days a week, and a night sitter would be required for three weeks. During the 11 months in the community on average the patient would receive four home visits from an occupational therapist and two from a senior clinical psychologist. In the last three weeks the patients would receive a hospice at home service, with round the clock attendance by a staff nurse.

The home help should be provided by the local authority. If, however, a shortfall of home helps is likely to jeopardise the whole community care package and result in inappropriate admission to hospital the health authority would have to provide this help. For this reason, the home help support has been costed with the other elements of this package.

About 30-50% of people receiving treatment with zidovudine (AZT) would require, on average, one blood transfusion (four units) every six weeks and roughly eight transfusions in the 49 weeks when they are likely to be taking zidovudine.

Assuming that between two thirds and all of the patients will be receiving zidovudine by the end of the financial year and that half of them will require transfusions, the number of blood transfusions required by the "average" patient has been estimated at four. Each blood transfusion necessitates an overnight stay.

The detailed breakdown of estimated costs is as follows:

£

(1)	One month's inpatient care	5600
	Four months' day care treatment, in-	
	cluding meals. This allows for one and a	
	half hours' nursing and transport and	
	nursing coordinator costs and over-	
	heads	3325
(3)	Seven months' management by the	
	acute district nursing service, includ-	
	ing overheads	3900
(4)	Blood transfusions £20 per unit (all	
	costs). Four units required at each of	
	four transfusions (zidovudine)	320
(5)	Four overnight stays in hospital as-	
	sociated with transfusions	730
(6)	Six outpatient visits plus transport	185
(7)	Home help provision: three hours per	
	day (seven days a week) for six months,	
	plus one hour per day (seven days a	
	week) for four months	2750
